Tomato Disease Prevention and Management

Tomato (Solanum lycopersicum) is prone to various fungal and bacterial infections.

Common Diseases:

1. Early Blight (Alternaria solani): Brown circular spots with concentric rings on leaves.
   Management: Space plants well for airflow. Apply copper-based fungicides or chlorothalonil.
2. Late Blight (Phytophthora infestans): Rapid water-soaked dark lesions on foliage and fruit.
   Management: Avoid overhead irrigation, remove infected plants immediately.
3. Fusarium Wilt: Yellowing of lower leaves progressing upwards.
   Management: Use resistant varieties and practice crop rotation with non-solanaceous crops.

General Prevention Practices:

Maintain proper soil drainage, practice drip irrigation, and mulch the soil to prevent spore splash.
